estimate the CO2 emission of the computer, so you can make an informed decision about what is best for the environment. Furthermore, Joulemeter can be used as a standalone application, but it works much better when used as a part of WattBack. Joulemeter is a very basic application that measures the energy used by computer components, and calculates the amount of CO2 emissions related to the computer usage. Joulemeter includes a basic panel that shows the Wattages that are being used by different components. Joulemeter also has a detailed information window, where you can view usage data, as well as learn about the power consumption and CO2 emissions associated with the monitored components.

Features of Joulemeter: View power usage by CPU, GPU, monitor, and peripherals. Calculate the total energy used by the computer. Measure and view the CO2 emissions associated with the different components. Output energy values as an integer and as a percentage. Measure the wattage of the CPU and GPUs. Calculate the amount of power consumed by the computer when it is idle, when it is in sleep mode, and when it is shut down.

Power consumption measured by Joulemeter: The program can be used with different types of devices such as desktop, notebook, or laptop computers. Using Joulemeter is quite easy and does not require much effort on the user's side. The interface is very simple, as it only
